In the Select Interval Rows and Columns dialog box, click the button to select the interval you need, select Rows or Columns from the Select section and specify the desired number in the Input Interval dialog box and in the Rows input box. The read function uses these prefixes when evaluating XPath expressions in an XML file. T = readtable("example.xml", "VariableSelector", "myprefix:Data", ... With VBA code, I can finish it as follows: 1. Set of registered XML namespace prefixes, specified as a comma-separated pair, consisting of registered namespaces and a set of prefixes. After installing the free Kutools for Excel, please do the following: 1. Drag the file to the Numbers icon in the Dock or Applications folder. Click anywhere on the table to select it. In the Format sidebar, click the Table tab, and then click Adjust Import Settings. Click the Delimited tab in the Import Settings window. Select one or more delimiter options next to Separate Values Using, or type in a custom delimiter. A delimiter is a character that defines column breaks. Do one of the following: Add text qualifiers: A text qualifier indicates where text begins and ends. Drag the blue arrows on the column address bar to adjust how many characters are in each column. Merge columns: Drag a blue arrow up and out of the address bar. Add a new column. Click anywhere on the column address bar. Encode text: Click the Text Encoding pop-up menu and choose an option. Transpose rows and columns: To transpose, or move, rows and columns in your table when importing, select A^T Transpose Rows and Columns. A^T Refresh Table. For example, evaluate an XPath expression in an XML file called example.xml that does not $of\Áatropmi\Áatropmi$ a ratsuja edop $\Áov$, aterroc recerap $of\Áan$ alebat aus e axif uo adadimiled arugral ed oviugra mu ratropmi $\Áov$ eS. alhocse aob amu $of\Áan$ odot $\Áan$ etse, salif ed sanetnec revuoh es sam, etnemlaunam sol; $\Ánoiceles$ edop $\Áov$. ecapsaman ed oxiferp mu You can not adjust the import configurations after editing the imported table. Drag the Excel file for the numbers icon in the dock or in the Applications folder. In the number menu bar, you can also choose the file> Open and select the Excel file you want to open. Drag the file for the numero icon in the dock or in the Applications folder. If the table does not look for right, you can adjust the settings. Enhances the interval that you want to select all other or NTH row. 2. Click Developer> Visual Basic, a new Microsoft Visual Basic for Applications window will be displayed, click Insert> Modes and enter the following code in the module: Uriarrow () Dim RNG as dark insertion as dark range as dim xinterval range as an integer xtypeid = "kutoolsforexcel" set inputrng = Application.Selection set inputrng = Application.Inputbox ("Interval:", xtypeid, InputRng.Address, type = 1) for i = 1 for inputrng.Rows.Count step xinterval + 1 set RNG = inputrng.Cells (i, 1) If the OTG is not then, then set OTNG = RNG ELSE SET OTNG = APPLICATION.UNION (OTNG, RNG) if you are in the next Utlgnq.entirerow.select the End of the 3, then end button. Run the code. Specify 'camellarapaces' as ["MyPrefix", " "] To assign MyPrefix prefix to URL. Select the creeper range that you want Shade range, click Kutools> Format> Alternate Line / Column Shading. By default, the reading function automatically detects namespace prefixes for use in the XPath evaluation, but also can register new namespace prefixes using the name argument of the income.
